I turned a cluttered, click-heavy plan screen into a practical interface, helping more than 12% of new users reach the magic moment

End-to-end

Challenge

I led a user sentiment analysis for Fryd for 2026, which defined the product with a high value proposition but low utilization quality. The consensus is that Fryd is "visually beautiful but functionally fragile." Some users find the app difficult to navigate, describing it as overly complicated and unintuitive for completing simple tasks.

Identify main UX issues

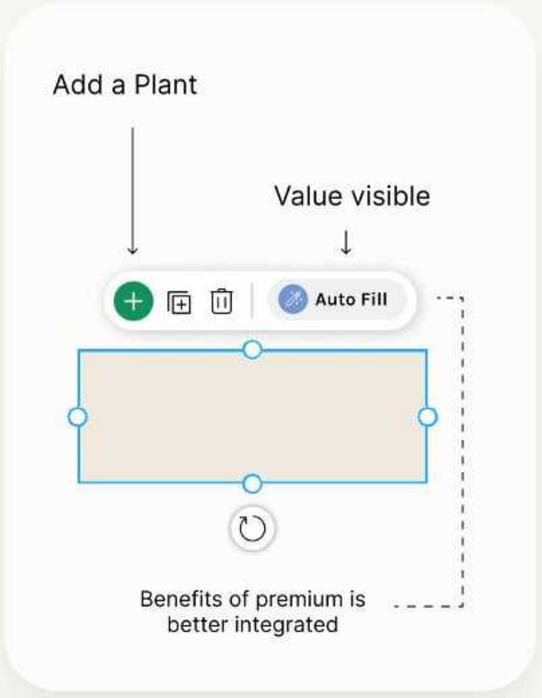

Cognitive Load
Users highlighted "Thousand options, but it's unclear how to operate any of them... for the simplest things you need what feels like 100 steps".

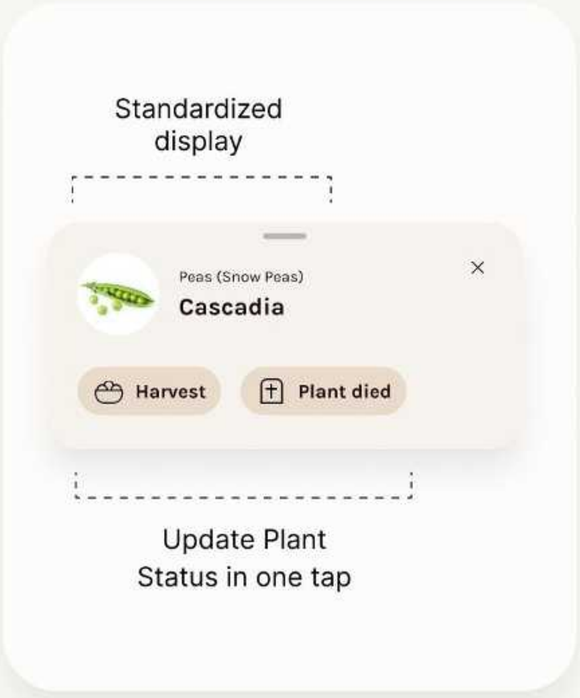

Broken Workflows
Users couldn't find intuitively how to add a plant easily which was corroborated by the amount of rage taps and dead clicks in the interface, sometimes leading to abandon.

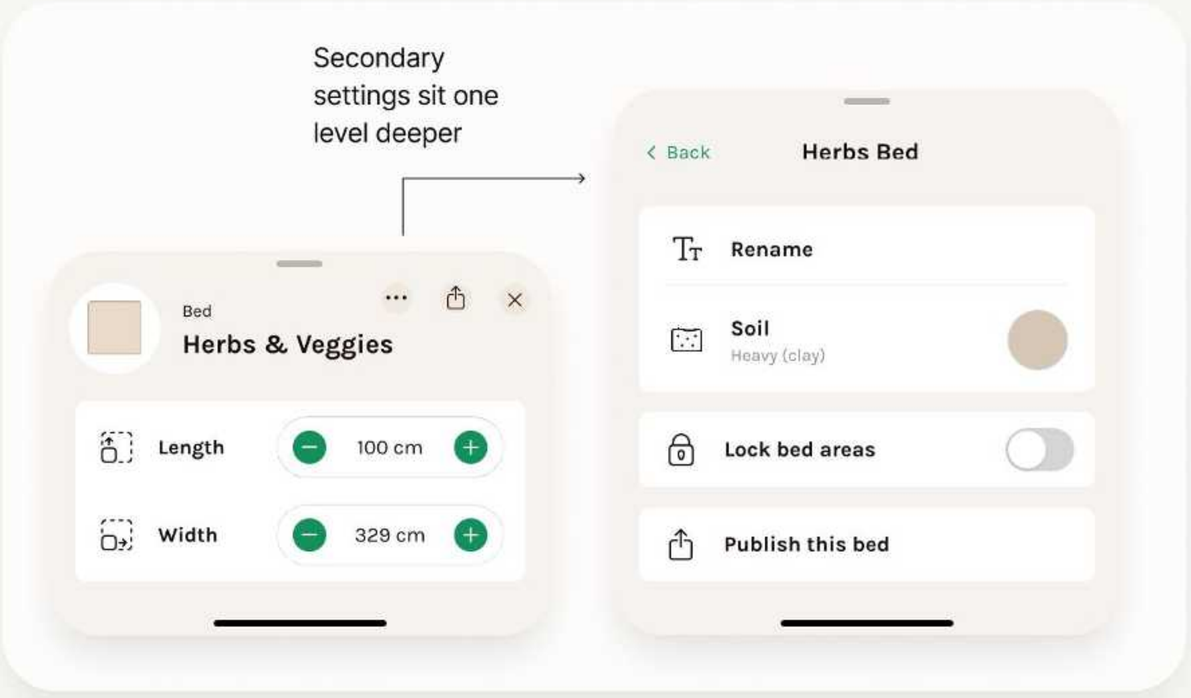

Approach

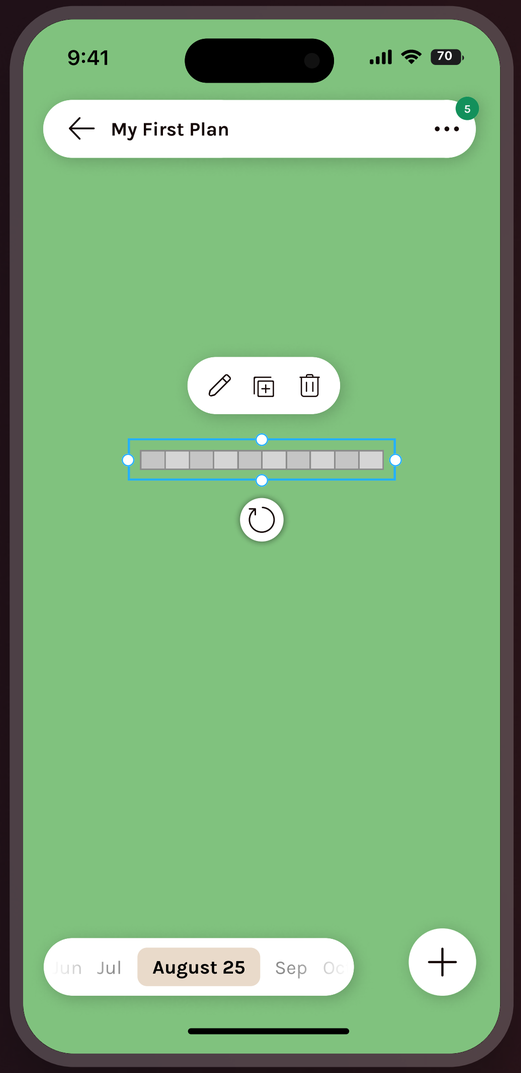

I targeted confusion behind usability issues by layering information and surfacing the most-used actions first. I pulled usability tests, appstores data, interviews and community insights into one priority set of actions.
I applied progressive disclosure through a bottom sheet system: every sheet in Plan follows the same three sizes (S, M, L), so primary actions are always visible and secondary ones follow a consistent hierarchy across all devices.

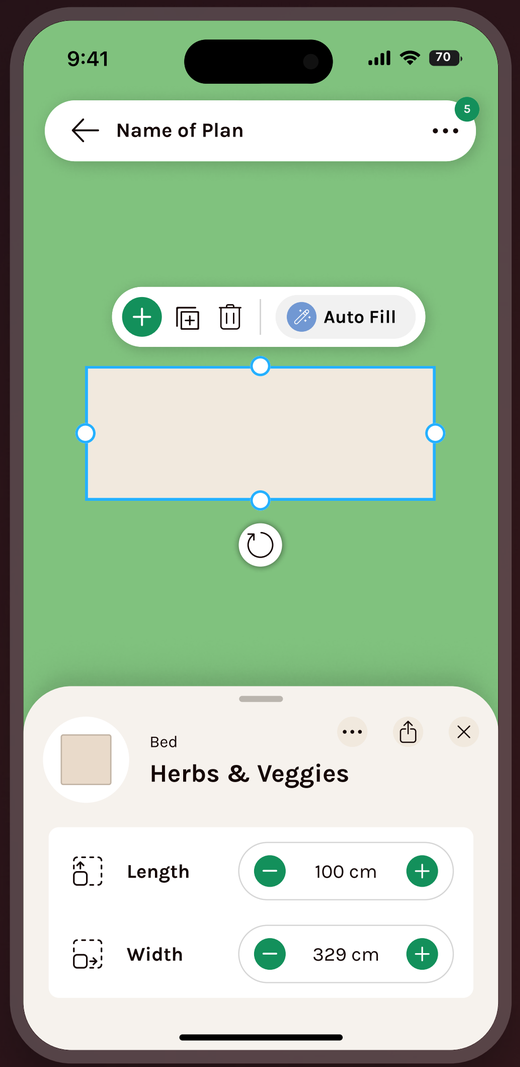

- → Add a plant in one tap
- → Resize/duplicate/delete a bed/element
- → Auto-fill a bed
- → Update a plant status
- → Find companion plants

I closed the feature gap between mobile and desktop by standardising all modals and toolbars across all breakpoints so a single change ships everywhere and dev implementation is faster.

Results & Impact

The new toolbar eliminated most rage clicks and dead taps in the Plan. Task efficiency improved, with a 25% reduction in time required for filling a planting plan. Product value surfaced more clearly, guiding more users toward activation (+12% reaching magic moment).

Bonus
We saw an increase of exposition to Super Fryd paywall and a bump in conversions through the Auto-Fill feature made more visible within the toolbar.

Following the positive results,
I rolled it out across the rest of the app for every device.
