2026

I am a senior UX/UI Designer. I design tools that help people move from intent to action, turning ideas into practical, manageable, and repeatable habits.

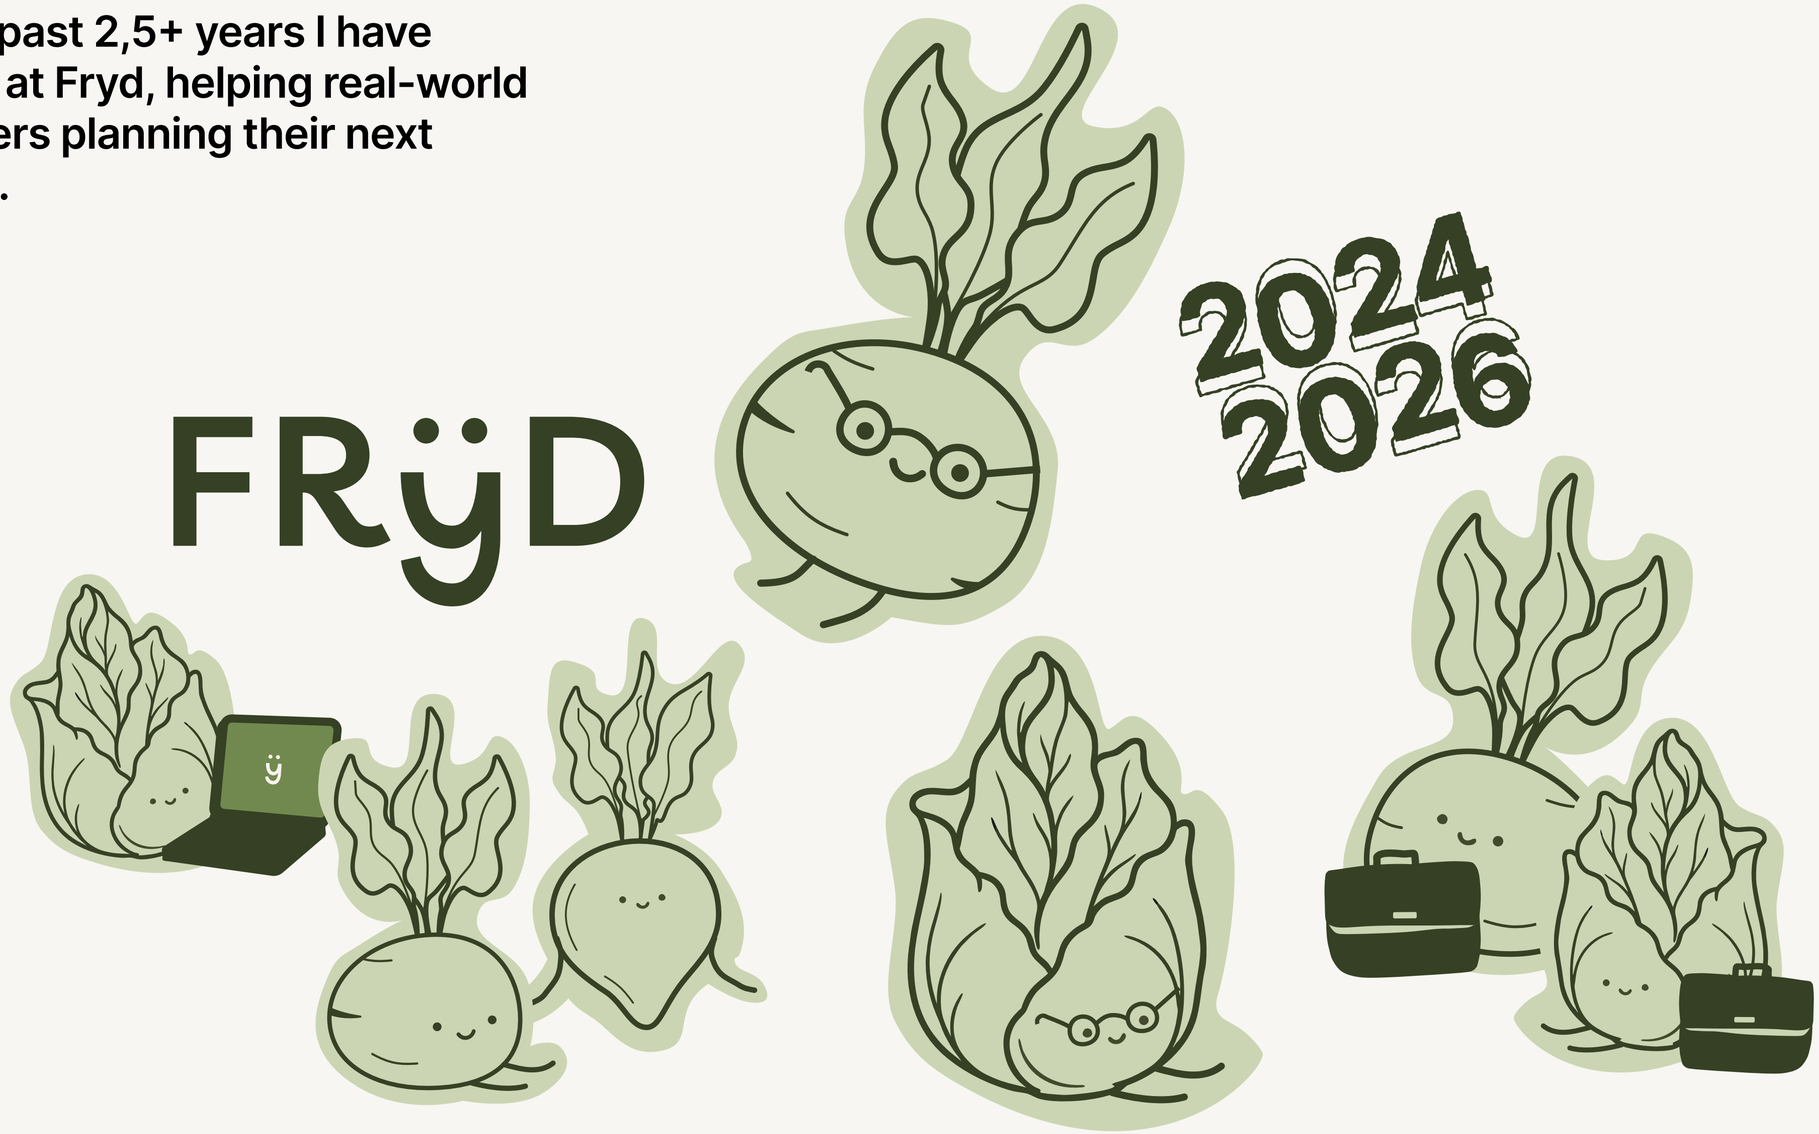

I’ve worked across the full product lifecycle, from early discovery and concept development to polished UI and developer handoff.

I’ve stayed close to my products long enough to see what works, what doesn’t, and spent time understanding why. That means shipping, measuring outcomes, seeing projects succeed or fail, and then iterating on real-world feedback rather than assumptions.

For the past 2,5+ years I have worked at Fryd, helping real-world gardeners planning their next harvest.

About

Product: Florian Haßler
Lead Designer & UX Research: Alice Le Corre
Dev: Steffen Abel

At Fryd, I designed for people with a goal: getting a little better at something they love every day. I worked on the moments that determine whether someone sticks around: getting started, understanding the product, building a habit, and discovering what's worth paying for.

What is Fryd

Fryd is a mobile-first gardening app that helps people plan and manage their vegetable gardens and connects them with an active community of gardeners.

Gardening requires people to constantly make decisions about what to grow, where to grow it, when to plant it, and what to do next.

Fryd's audience is made of new gardeners trying to figure out what they are doing and not getting discourage with the learning curve, and experts who have a precious non written knowledge.

What did I design?

I led the 3 next projects end to end, from research and ideation through design and testing, all the way to live.

The product team is made of 2 software engineers, the CEO acting as Head of Product and I am the lead designer.

Turning a seasonal gardening app into a year-round garden companion

Experimentation Strategy

Context

Gardening is not a science, but it often feels like it. Rooted in gut feeling and intuition, despite many years of practice and experiments gardeners still feel like beginners.

Interviews kept surfacing the same things: users want to feel confident in what they're doing, and they want to document their experiments without learning the complex science. The real friction is deciding 'what to do next'.

Yet, only 2% of our users used the "Care" tab containing to-dos, because they are generic and related to plant and time in-season, but aren't contextualized nor explained.

Challenge

How to define what's the most important thing to do right now, when there's no single right answer?

How to help gardeners build confidence and up-skill easily, without becoming experts?

Business: Fryd slowly loses 60% of its active users every winter due to the inherent seasonality of gardening, costing the company revenue every year. The product needed a "pull" feature: something strong enough to run ads on and attract new users even off-season.

Goal

Increase Active Users and Subscribers

Turning a seasonal gardening app into a year-round garden companion

Switch to action-led gardening: Help gardeners know what to do next, every day of the year.

All users regardless of experience level, geography, age, or garden size, expressed a need to get help in making smart decisions effortlessly, so they can spend time gardening instead of researching.

Approach

To understand what gardeners actually struggle with, I ran user interviews and onboarding A/B tests. The same pain kept surfacing: not knowing what to do next, and the stress of getting it wrong.

This surfaced three key needs:

↘ Effortless smart decisions (20/20 users)

Effortless smart decisions (20/20 users): Automated guidance on companion planting, spacing, timing, and rotation, so users spend their time gardening instead of researching.

↘ 14/20 users: Clear next actions and timing

A clear view of what to do and when across overlapping tasks and timing windows, to maintain a continuous harvest without gaps or missed deadlines.

↘ Automatic garden memories (12/20 users)

A journal that tracks what was planted where, so users can learn from past seasons and avoid repeating mistakes.

Users had been asking for a journal feature, and the market had no decent solution, with most users still relying on pen and paper.

It also revealed a retention opportunity: once users have 2+ years of data, switching cost becomes prohibitive.

Insights

"I actually feel like I could get good advice from an app like this. [...] It could make me feel less lost."

"I don't feel like having to learn all that. It's just such a super-complex task. I'm just getting started."

"I would like to confirm what I might already know. Or something that points out where I'm wrong."

"The problem with lists and notes is that after two months, even I can't read them anymore, then they're lost on me."

"I could have meticulously documented all of that over the years [...] But that's where my consistency ends."

Core concept

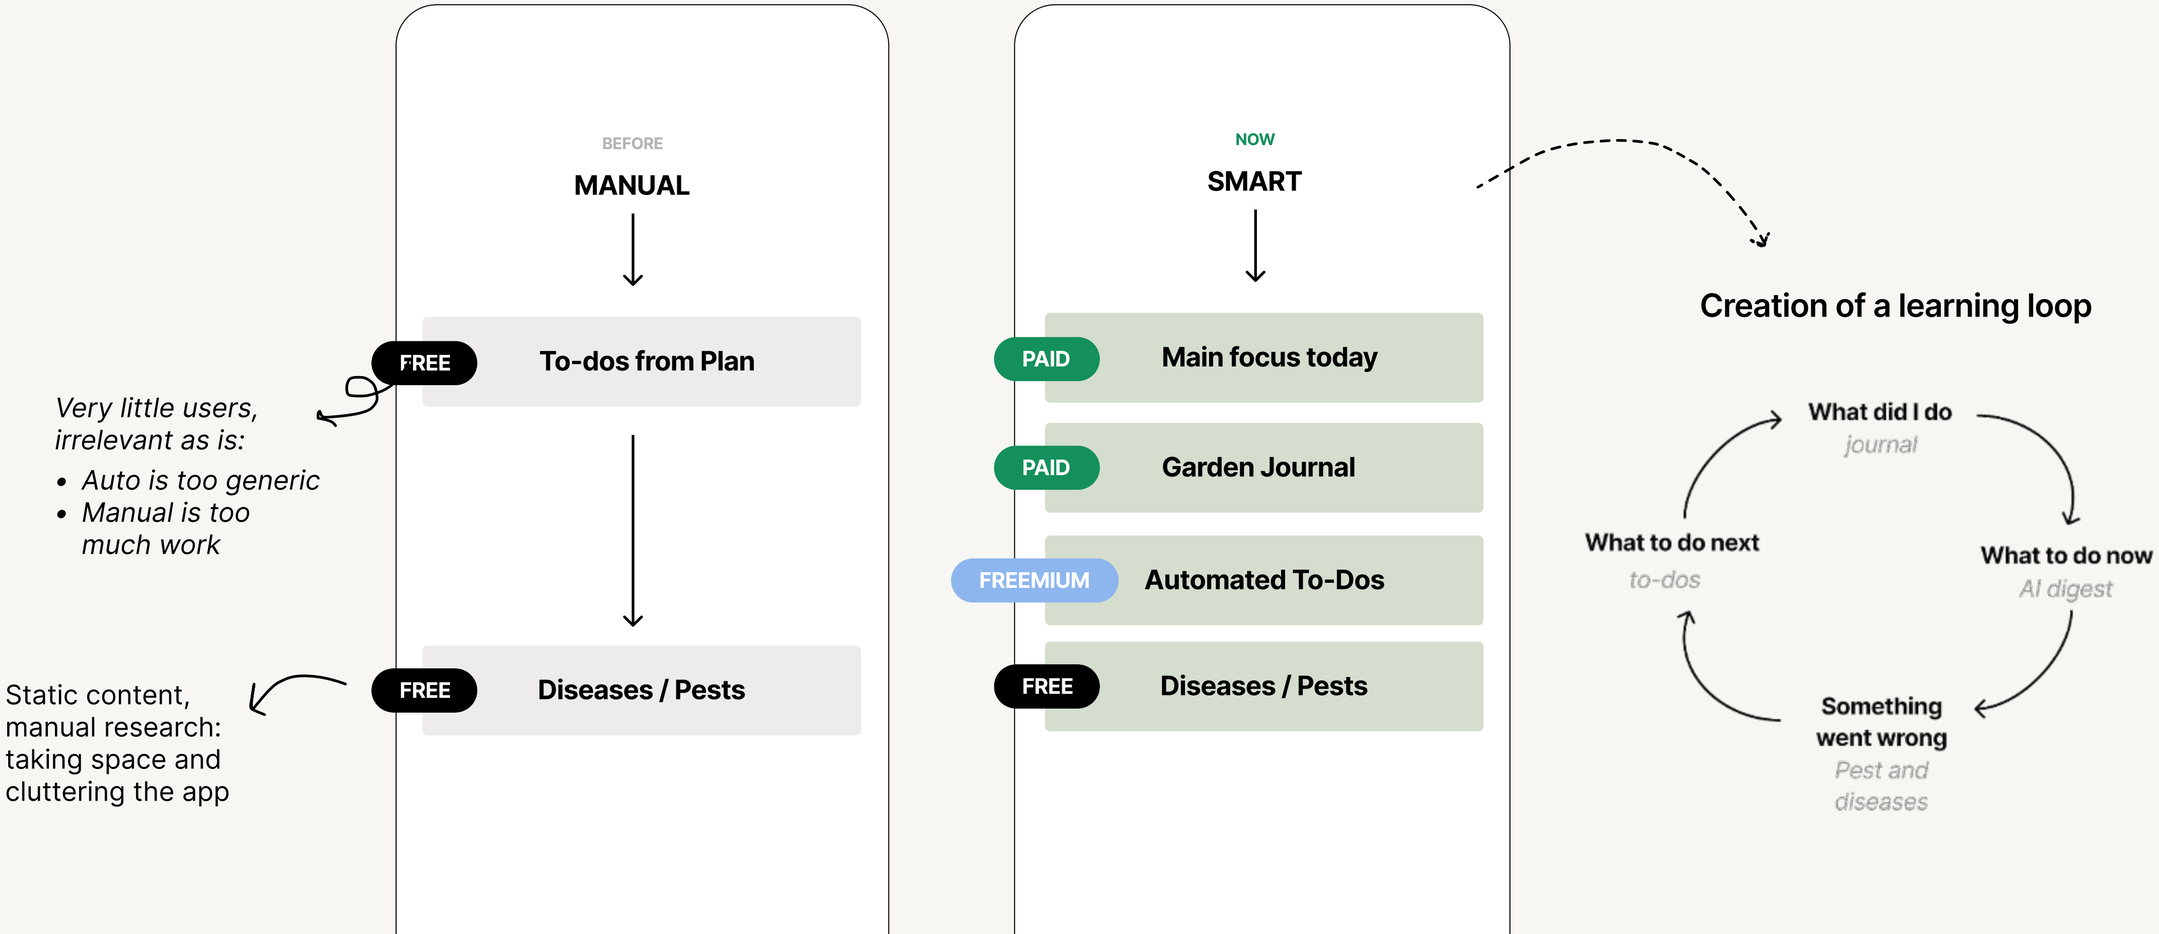

- **High effort**
- **High impact**
- **High confidence**

Never Grow Alone

Based on the research, we established a new brand direction “Never Grow Alone” and I designed "Action-Led Fryd”. Users don't have to think about what to do next, they open Fryd and get the guidance needed based on their very own garden.

Manual to Zero-Decision

Action-led Fryd focuses on taking the mental load out of gardening and shifting the product interface from a manual data-entry chore to an evolving zero-decision garden companion.

WEATHER ALERTS

Weather alerts in case of storms, extreme heat or cold.

CALENDAR

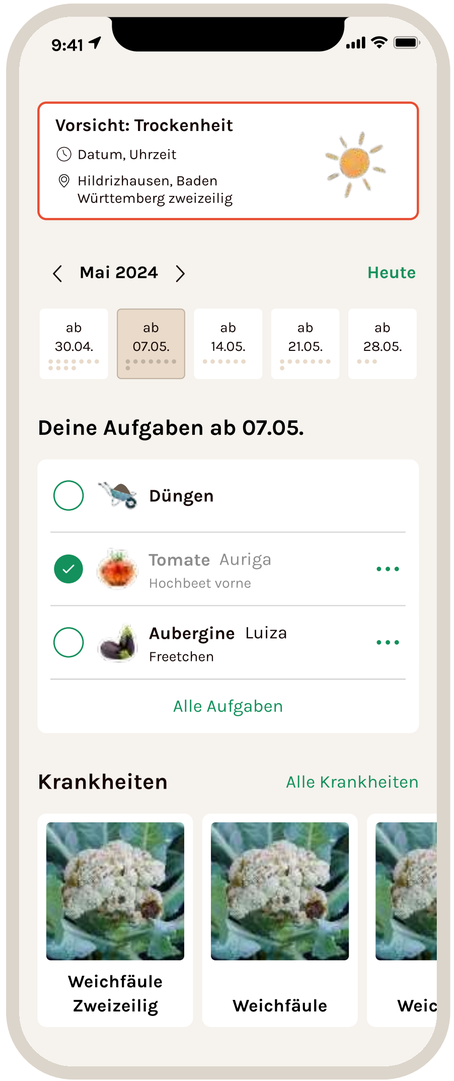

Only shows a date when there is a to-do.

TO-DOS

Confusing to-dos, generated automatically based on the species and timeline.

PESTS & DISEASES

Static library of all pests and diseases and solutions to handle it.

DYNAMIC WEATHER

Immersive interface changing according to local weather.

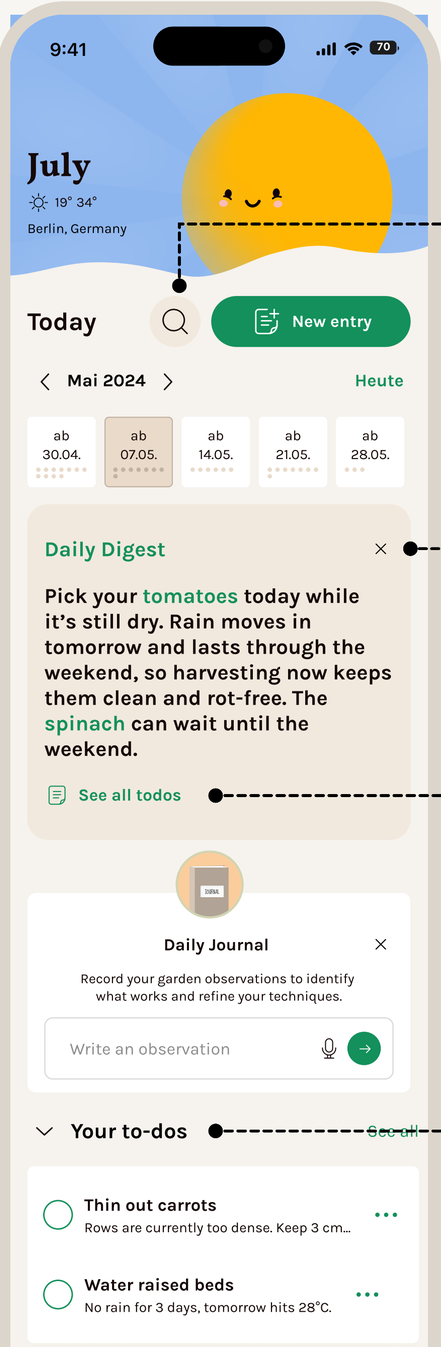

20+ Fryd widgets for Apple and Android native home created

DIGEST

AI powered most important to get done now. It pulls input from the journal (user data), garden experience, users around you, weather info and plant seasonal data

JOURNAL

Plants are tagged and a tap opens the specific plant page. Several species can be highlighted within one digest.

SEARCH WITHIN ACTIVITY

CLOSE

After 3 times, it triggers a modal asking users if they'd like to hide the feature (in anticipation to AI skeptical audience)

SEE ALL TO-DOS

Smart to-dos and journal entries are now gathered in a clear Garden activity interface.

SMART TO-DOS

Pulled from journal input, digest, planting plan and seasonal calendar in users region.

GARDEN JOURNAL

At D14 we realised 38% of users hit the journal paywall but only 7% converted

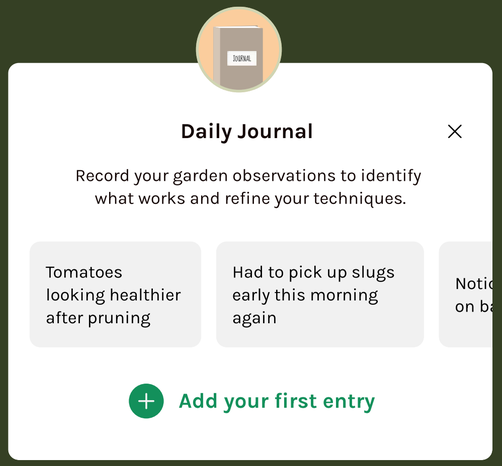

Demand is real but monetisation isn't proven yet

56% of users who created a first entry, created 3,5 entries/ per week

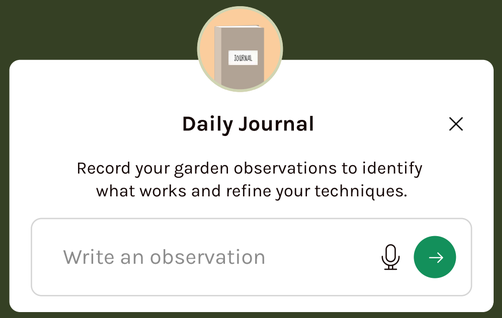

Repeated habit

1

SUPER FRYD

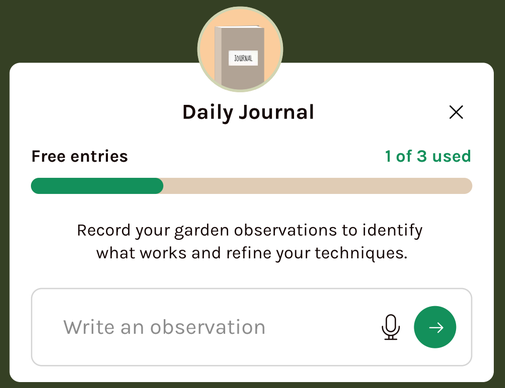

DAILY EMPTY STATE

SUPER FRYD

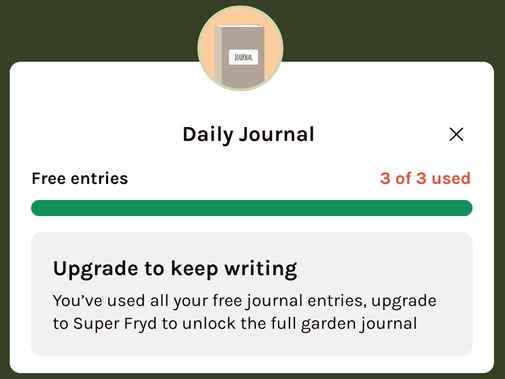

AFTER 1 ENTRY

2

FREEMIUM

FREE ENTRIES

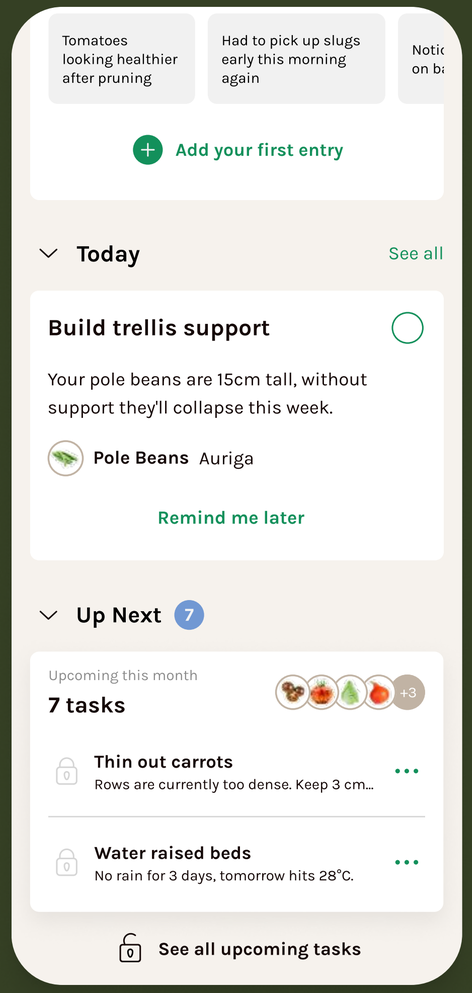

NO FREE ENTRIES LEFT

We decided to re-launch the feature to all users with 3 free entries to boost activation

DAILY DIGEST

First designs were highlighting the one thing to do now as an item list to tick off

But after running some tests, we realized... it's impossible because it's inacurate or would need a single priority score between all species.

Emotional job is broken

We focused on short advices instead, contextualizing priorities and using real user input such as climate, experience and time.
And generated to-dos from there.

Daily Digest

Pick your tomatoes today while it's still dry. Rain moves in tomorrow and lasts through the weekend, so harvesting now keeps them clean and rot-free. The spinach can wait until the weekend.

See all todos

Daily Digest

Harvest your broad beans today. Eight other plants are ready for picking. Plan to fertilize your brussels sprouts this saturday right ahead of the rain.

See all todos

Daily Digest

Your winter crops can stay in the bed for now. Frost is expected tonight. Protect any young plants and check that your pots are insulated. Good time to clear diseased leaves and add a layer of
